

Property of:

London Geographical Society.

You are part of an expeditionary force and find yourself in a remote part of the Amazon Rain Forest.

You have been sent here by the London Geographical Society to unearth the mystery surrounding the 1894 expedition that disappeared without trace having allegedly discovered the lost gold of the Incas.

From a diary that you have found you know that gold is hidden somewhere on a remote island.

You are also aware that the island is inhabited by 7 highly territorial tribes, some of whom are known to not only be aggressive, but to also have cannibalistic instincts.

Your task:

Provide a detailed account of where the 7 tribes reside.

Locate the area occupied by the **Viroconium** tribe where the treasure was buried by giving the correct 4 figure grid reference so we can send in additional teams and recover the lost gold.

There are a few additional facts you must be aware of:

Your task, as a team is to find the grid exact location by correct grid reference where the treasure is buried.

1) The **Dumonia** tribe has a staple diet of tree monkeys and they control the territory closest to their food source.

2) The **Cornovii**, **Dumonia**, **Kernow** and **Viroconium** tribes are all cannibals.

3) The **Prideau** tribe is poorly-equipped to defend themselves and consequently their territory does not border onto any land occupied by cannibals.

4) The **Kernow** often eat green toads from the Island's ponds. They can only reach these ponds by in a direct line by crossing the **Cornovii**, **Dumonia** or **Congresby** land.

5) The **Armonica** Tribe is due south of the **Congresby** Tribe.

6) You know the treasure is buried in the **Viroconium** Tribe's land.

7) There are 7 designated dwellings as shown on the map.

8) The grid references given are made on the assumption that all dwellings are in the centre of the square.
